

The Commission's proposals start with ambitious targets to reduce waste. By 2030, 65% of municipal waste and 75% of packaging waste is to be recycled across the EU, with a maximum

of	10%	of	all	waste	dis	posed	of I	by	landfill.

One proposal is to ban landfilling waste divided for separate collection, as is frequent with plastic and materials left over from demolition. "This is the case with most packaging materials, so the packaging sector is probably an issue where we can go further the fastest," Katainen said. "The biggest challenge is often how to organise separate collection. But in some member states, glass recycling is nearly 100%, so why put any glass in landfill? Member states could share best practices."
